

English practice for technical meetings ✓

claude, i need to improve and practice more my english, can you create a english class to we practice? conversation and technical english, I'm an mechatronic engineer, doing a masters degree in Applied AI, and like you know i have some technical meeting with suppliers around the world so i need to practice my conversation and technical english, also review some grammar concepts, have had, phrasal verbs, future, past, things like that, how can we do that?

Hi Aluizio! Happy to be your English practice partner. Let me lay out a structure, then we can start right away.

Here's how we can run these sessions:

1. Warm-up conversation (5 min)

We chat about your week, your masters work, anything. I correct your mistakes gently and point out more natural phrasing.

2. Technical role-play (the core)

I play a supplier, vendor, or colleague, and we simulate a real meeting: negotiating specs, discussing a delivery delay, troubleshooting a component, explaining your AI project. This is where you build the fluency you actually need.

3. Grammar focus (10 min)

We pick one topic per session (perfect tenses, phrasal verbs, future forms, conditionals) and I explain it, then you practice with exercises tied to *your* field, so it sticks.

4. Feedback summary

At the end I give you a short list: what you did well, recurring mistakes, and 3-5 useful words/phrases to remember.

A quick note on your own message, since correcting is the point: a few small fixes:

- "create a english class to we practice" → "create an English class *for us* to practice" (and "an" before a vowel sound)
- "an mechatronic engineer" → "a mechatronic engineer"
- "like you know" → "as you know"

Let's start now. I'll ask a few things to tailor the sessions:

Q: What's your current English level (self-assessed)?

A: Advanced (C1)

Q: What should we prioritize today?

A: Conversation practice

Q: For the technical role-play, which scenario fits you best?

A: Negotiating with a supplier

Great — C1 with a focus on conversation today. At your level I'll be stricter: I won't just fix errors, I'll push you toward more natural, idiomatic, professional English. Let's go.

Conversation warm-up

Tell me about your masters work. What's the focus of your Applied AI degree right now — is there a specific project or research problem you're working on? Talk freely, and I'll give you feedback on phrasing, word choice, and naturalness afterward.

While we're chatting, I'll keep an eye out for the kind of small things that separate "very good" English from "native-like" English — article use, prepositions, collocations, and rhythm.

When you're ready, just answer in English and we'll build from there. To keep it realistic, here are two follow-up angles you can pick from, or ignore and just talk:

- What problem does your research actually solve, and for whom?
- Where does the supplier/technical-meeting side connect to your AI work?

Go ahead — write a few sentences about your project, and don't overthink it. The goal is fluency first, polish second.

Can you hear me?

Ah right, sorry — I should clarify. I'm reading text that's been transcribed from your voice, so I'm hearing you through the transcription. Go ahead and speak naturally about your masters work, and the transcription will come through to me. I'll respond back to you as speech through the text-to-speech system.

So whenever you're ready, tell me about your Applied AI degree and what you're focused on right now.

So I want you to take some notes about the... about last day... yesterday that I have... that I had some meetings with our tech from Drainville and with develop from Wisconsin. About our tech, they told me that they can do the the work. They can do the modular all drives test system. And They said that it will be useful to have something to stop the fire if the product is on test, um, explodes or something. So it is useful to us to know about it and to add this this feature to the load test module. And, also, the developers told me that they can do... they can build the the module tests, and they said the same thing that I'll text him. So we'll be... it it was good for us to know about it. We didn't know about it before, so I guess we'll be good to add this to the scope.

Right, brilliant — let me take those notes and then we'll do some feedback on the English.

Meeting notes — yesterday:

Supplier 1: Our Tech (Drainville)

- Confirmed capability to build the Modular All Drives test system
- Flagged safety feature: fire suppression system needed if product explodes during testing
- Action: Add fire suppression to load test module scope

Supplier 2: Develop LLC (Wisconsin)

- Confirmed capability to build the modules
- Raised same safety concern as Our Tech
- Action: Incorporate into scope

Impact: This is a valuable alignment — two independent suppliers flagging the same gap means it's legitimate. Good catch adding it to scope.

English feedback — you're solid overall, but a few things to tighten up at C1:

- "yesterday that I have...that I had" → **"Yesterday I had meetings..."** (avoid the false start in formal speech; "had" is correct past tense)
- "our tech from Drainville" → **"Our Tech from Drainville"** (proper noun — capitalize it)
- "they can do the work...they can do the modular all drives" → You're repeating the verb. More natural: **"They confirmed they can build the Modular All Drives test system."** One strong verb beats two weak ones.

- "it will be useful to have something to stop the fire" → **"It would be prudent to include fire suppression"** (more precise and professional for a technical meeting)
- "We didn't know about it before, so I guess we'll be good to add this" → **"Since neither supplier mentioned it initially, we'll definitely incorporate this into scope."** (avoid "I guess" in technical contexts — sounds uncertain. "Definitely" or "certainly" is stronger.)

Phrasal verb note: You naturally avoided them here, which is smart in formal meetings. But "add to scope" works — that's a solid collocation.

Ready for the supplier negotiation role-play now?

So, uh, listening to what I said to you, what do you think about my English? Do you do you think that I need to work on some grammar topics? And do you think that I I need to practice every day? Because I I guess it will be useful to practice every day to improve my conversation and to improve my, um, I don't know how to say that in English, but the Yeah.

pronounced. Yes. Pronounced. Pronounced will be better if I practice every day. And did you take the notes that I told you? Did you save it in some place? So for for today, I have two meetings. The first one will be with Mondragon from Spain, but they have a facility here in Brazil. I I think they will build the machine here in Brazil. to provide support after. And about MassMec, MassMec is the other meeting that we will have today, and they are from Italy. And I think they will build the machine in Italy and then do the fat and set. to provide the machine for us. When when I say machine, I'm meaning the test module system modular all drives.

Good questions — let me give you honest feedback, then we'll sort the practical bits.

On your English overall:

You're genuinely strong. Your grammar is solid, vocabulary is technical and precise, and you communicate clearly. But at C1, there's a gap between "very competent" and "polished professional" — and that gap matters in high-stakes supplier meetings where you want to sound authoritative and confident.

The main things I'm hearing:

1. Hesitation and fillers — "uh", "um", "I don't know how to say that", "Yeah", pauses. These aren't grammar errors; they're confidence signals. Suppliers notice them. At

your level, you need fluency without the thinking-out-loud.

2. Repetition — "they can do the work...they can do the modular all drives", "I I think", "for for today". Clean this up with more deliberate phrasing.

3. Pronunciation — You said "pronounced" when you meant *pronunciation*. Small thing, but it matters. I'd recommend recording yourself and listening back.

4. Minor grammar — "to provide support after" is vague. "To provide post-commissioning support" is tighter. "FAT and set" — did you mean FAT (Factory Acceptance Test) and SAT (Site Acceptance Test)? Say the acronyms clearly.

Should you practice daily?

Yes, but *strategically*. Not random chat — focused supplier-meeting simulations, 15-20 minutes, 3-4 times a week. Daily is burnout; consistent beats intense.

On your notes:

I've got them mentally, but they're not saved anywhere permanent. If you need them for actual follow-ups, jot them yourself or ask me to help you draft the email summaries afterward. That way you're also practising written English.

Today's meetings — Mondragon and MASMEC:

Let's role-play one of these. Pick one, and I'll play the supplier contact. You lead the call as if we're on Zoom — opening, agenda, key questions. This is where we fix the hesitation and build real meeting confidence.

Which one first?

Let's simulate Malnik. Malnik. Mads Nik.

I'm not catching that clearly — is it one of the suppliers you mentioned, or a new contact? Let me clarify:

Are you saying **Mondragon** (the Spanish one with the Brazil facility)? Or is **Malnik** someone else — maybe a person's name from one of today's meetings?

Give me the spelling or context and we'll start the...

Messmic.

Ah, got it — **MASMEC** from Italy. Perfect.

Right, I'm playing the MASMEC contact. We're on a Zoom call, it's the start of the meeting. You open it — greeting, introduce yourself, set the agenda, and kick things off naturally as you would in a real call.

Go ahead. I'll respond as they would, and we'll build the conversation from there.

Hi, everyone. Um, my name is aluizio, and me and my friends here, we work... my colleagues actually, we work at the Wex Drive's production, uh, and we developed a system and assembly lines to new products in the factory. So the the reason for this meeting is to know if MassMack is capable to build the modular all drive test system and also develop assembly lines fully automated to assembly the products with auto... assembly the products automated. Also,

Right, let me stop you there — not because you're wrong, but because we're at a teaching moment.

What worked: Your opening was clear, you named the company and your role, agenda was understandable.

What to tighten up:

- "me and my friends here, we work... my colleagues actually" — this sounds uncertain. Pick one: "I'm here with my colleagues from WEG Drives." Cleaner, more authoritative.
- "we developed a system and assembly lines to new products" — awkward. Say: "We're developing an automated test system and assembly line for our new product line." (Present continuous fits better — it's ongoing.)
- "MassMack" — you said it, but it's **MASMEC**. Pronunciation matters; suppliers notice if you mispronounce their own company name. Say it clearly: "mass-meck".
- "to know if" → "to determine whether" (more formal, professional).
- "build the modular all drive test system" — good. But then: "develop assembly lines fully automated to assembly the products" is repetitive and grammatically

off. Say: "and whether you can design and build fully automated assembly equipment to manufacture these products."

Restart it. Same opening, but tighter:

Go again from "Hi everyone" — same content, but without the hesitation, without the self-corrections, and with those phrases polished. Treat it like you're actually on a call with a supplier you respect.

Okay.

Let me give you the cleaner version and then we restart:

"Hi, everyone. I'm Aluizio from WEG Drives & Controls. I'm here with my colleagues. The purpose of this meeting is to understand whether MASMEC can build the modular all drives test system and support fully automated assembly lines for our new products."

See...

That's fine.

Right, let's restart. You're opening the call with MASMEC again — this time, be more direct and confident. No "um", no backtracking. You've got this.

Go:

Yeah.

Go ahead — open the call to MASMEC now. Greeting, introduce yourself and WEG, state the purpose of the meeting. Keep it clean and direct.

Okay.

I'm ready when you are. Start the call.

I haven't received.

Sorry, I'm not following — what haven't you received? Are you saying you need a moment, or is there something else you need from me before we start the role-play?

Okay. I will I will talk again. So my name is alizio, and I'm from Wag Drives. Me and my colleagues here, we work at the industrial engineer section, and we develop test systems and assembly lines for new products to the factory. So we we prepare the the factory for new products... to produce new products in the the objective of this meeting is to see if MassMack is capable to develop the test system and maybe some assembly lines fully automated.

Good — much better. More confident, clearer structure. A few notes before I respond as MASMEC:

What improved: Direct opener, roles stated, purpose clear.

Small refinements for next time:

- "alizio" → say your full name clearly: "Aluizio"
- "Me and my colleagues" → "My colleagues and I" (formal, professional)
- "we we prepare" → just "we prepare" (no stutter)
- "to the factory" → "in the factory" or "for the factory"
- "MassMack" → "MASMEC" (you keep shifting the name slightly — lock it in)

Now, as MASMEC:

Thank you, Aluizio. Good to meet you. Yes, we've reviewed the RFQ. We're very interested in the modular test system. Before we dive in, I have a few questions: First, what's your timeline? And second, are you looking for us to build this entirely in Italy, or do you have preferences about where the assembly and commissioning happen?

Go ahead — respond naturally.

For the first question about the timeline, our deadline will be in the end of two thousand twenty seven. So the test modular or drive test system needs to be commissioned here in Brazil by the end of two thousand twenty seven. And about where we are looking for your company to build this, definitely will be better if you could give this in Italy. But if you cannot, thousand.

Strong answer — you're staying on track. A couple of tweaks:

What worked: Clear timeline, specific deadline, you stated your preference but left room for negotiation. That's good supplier management.

Small fixes:

- "our deadline will be in the end of two thousand twenty seven" → "our deadline is end of 2027" or "by the end of 2027" (more natural, avoid saying numbers out loud unless necessary)
- "the test modular or drive test system" → just "the modular drive test system" (you're repeating)
- "if you could give this in Italy" → "if you could build this in Italy" (clearer)
- You trailed off at "if you cannot, thousand" — finish the thought clearly: "...but if you can't, we're open to alternatives."

Now, back to MASMEC:

Building in Italy works for us, but we'd need to factor in logistics to Brazil — FAT here, then shipment and commissioning on-site. That adds lead time. One more thing: do you have a budget range, or are we quoting open-ended? And who's supplying the electrical components — WEG or us?

Your turn. Answer both questions directly.

about the budget range. We don't have a budget range. What we work here is with the payback. So if the payback is acceptable, we can do it. We can buy it, but it's all about the payback and the quality of their supplier. And, also, we will supply all the electrical components that we produce. So if you have some components that you don't work, you need to Terrace and make it clear on the quote to... we know if we cannot accept these components because we prefer to use the components that we produce than the.

Excellent — you're handling this like a pro now. Much more confident, natural flow. A few polishes:

What worked: You explained the payback model clearly, stated your sourcing preference, and set expectations. That's exactly how this conversation should go.

Small refinements:

- "if the payback is acceptable, we can do it. We can buy it" → remove the repetition: "If the payback is acceptable, we'll move forward."
- "you need to Terrace and make it clear" → I think you meant "you need to **flag it** and make it clear" or "you need to **call it out** on the quote" (Terrace doesn't work here)
- "we prefer to use the components that we produce than the" — you trailed off, but the idea is clear. Better: "we prefer to use our own components whenever possible."

Now, as MASMEC:

Understood. Payback-driven, we've got it. And on the electrical components — that's fine, we'll source standard industrial items and flag anything outside WEG's portfolio on the quote. One last thing before we close: timeline-wise, if we start engineering in Q3 this year, can you commit to a decision by end of Q4? We need that to lock in our capacity.

Your response: Answer the timeline question, then close the call professionally (next steps, thank you, etc.).

We are looking for the kickoff to start as soon as possible. So for us, if the payback be accepted and we do some meetings, technical meetings to to share some knowledge about the test sequence, about the drives, and it's clear for your company. We can start as soon as possible. So about this timeline wise, we don't have problems with that. We just need to be fast.

Solid negotiation — you're pushing for speed while staying reasonable. A few refinements:

What worked: You tied the decision to technical clarity (smart — it's not arbitrary), you're flexible on their timeline, and you emphasized urgency without being aggressive.

Small fixes:

- "if the payback be accepted" → "if the payback is acceptable" (subjunctive mood isn't natural here in English)
 - "to to share" → "to share" (no stutter)
 - "it's clear for your company" → "it's clear to your company" or better: "once we've aligned on the technical requirements"
 - "We just need to be fast" → "We need to move quickly" (more professional)
-

Now close the call professionally. Say something like:

- Recap one key point
- Confirm next steps (when do you send the quote? When's the next call?)
- Thank them
- Professional goodbye

Go ahead — wrap this up as you would in a real call.

Okay. Just to recap one key point, the budget rent is not a problem. We just need to make the payback acceptable, and I just need to confirm some next steps. Like, when you are going to send the quote. And, also, thank you. Appreciate your time. Appreciate your your attention. And I'm waiting... I'm looking forward your answer about the quote.

Thank you, guys.

Very good close — professional, clear next steps. Just a couple of final touches:

What worked: You recapped the key point, asked for the quote timeline, thanked them. Natural rhythm.

Final polishes:

- "the budget rent is not a problem" → "budget isn't a constraint" (cleaner, no "rent")
- "to to make" → "to make" (no stutter)
- "Appreciate your your attention" → just say once: "I appreciate your time and attention"
- "I'm looking forward your answer" → "I'm looking forward **to** your answer" (preposition matters)
- "Thank you, guys" — good, but you could end even stronger: "Thank you again. We'll be in touch soon."

Overall feedback on that call:

You went from hesitant and repetitive at the start to **genuinely professional** by the end. Your negotiation instincts are solid — you didn't cave on payback, you set expectations, you confirmed next steps. That's exactly what a C1 speaker should do.

Three things to work on for your next supplier call:

1. **No filler words** — record yourself and listen. Catch the "ums" before the call.
2. **Finish your thoughts** — you trailed off twice. Pause, breathe, then speak cleanly.
3. **Prepositions** — "looking forward to", "flag on the quote", "clear to them" — these trip you up. Worth a quick review.

Want to do Mondragon next, or should we switch to grammar focus?

Let's switch to grammar focus.

Right. Given your supplier calls, let's focus on **verb tenses** — specifically the ones that trip you up most in negotiation and technical English.

From your MASMEC call, I heard:

- "if the payback **be** accepted" (wrong subjunctive)
- "we'll **be** commissioned here" (correct, but let's solidify future)
- "you **need to flag** it" (present obligation — good, but let's cover all angles)

Today's topic: Future, Conditional, and Obligation.

Three core structures for supplier meetings:

1. Simple Future vs. Going To

- "We **will send** the quote by Friday" (decided, committed)
- "We**'re going to build** this in Italy" (plan, intention)

2. First Conditional (Real possibility)

- "If the payback **is** acceptable, **we'll** move forward" (likely to happen)

3. Second Conditional (Hypothetical)

- "If we **had** more time, **we'd** add load testing" (not likely, imaginary)

Quick check: Which one feels weakest to you? Or should I give you three example sentences — one from each — and you translate them naturally from a supplier-call perspective?
